

# HyFIBER®

# GUIDELINES FOR ENTERAL USE

## Product Description

The presentation of HyFIBER allows it to be administered in a way that best suits each patient's need - either directly through an enteral feeding tube or via an enteral giving set. Below is a suggested method of administration which is quick, easy, limits any wastage and reduces contamination risk.

**Important:** Do not mix HyFIBER with medications or other enteral feeds prior to administration.

## Guidelines for use

1. Remove the plunger from a 60ml enteral syringe
2. Connect the enteral syringe to the patient's enteral feeding tube or giving set
3. Open sachet or bottle of HyFIBER
4. Pour the sachet or measured serve of HyFIBER directly into the top of the syringe

**Note:** We recommend flushing the patient's feeding tube with water both before and after the addition of HyFIBER.

## Important Notice

The information included on this poster provides general guidelines only. Specific national, local, or trust guidelines surrounding enteral feeding or the use of enteral feeding tubes, enteral giving sets, or enteral feeding pumps should always be considered alongside these product specific guidelines and discussed with the hospital nursing and / or dietetic team if necessary.
